"South side of the Glide Plane released as a glide avalanche last evening (May 12th) sometime around 6 pm according to source. Bed surface was ground in starting zone of wet clay soil sparsely covered in long grass. Debris chunks, some snowmobile sized, rode up on surface and slid approx. 200 vert. Debris could have bumped a tower on the old Alpine lift if it still lived there. Last freeze was 6 am on the 10th of May. The high temperature on the 12th was 59 degrees at 4 pm."
