

Limited surface instability in the Bridgers

Date

Thu, 03/14/2024 - 10:40

Activity

Skiing

Skied up around Frazier Basin today, found limited instability in the new snow beyond sluffing. Wind loading was minimal with no large drifts, and no cracking in the new snow. Underneath the new snow was a very supportive crust on all aspects. Did not see any new avalanche activity, but we did see numerous large old slides. Did see a good amount warming on solar aspects until the clouds moved in around noon or 11.

Region

Bridger Range

Location (from list)

Frazier Basin
