Activity

Skiing

Toured up north of the ski area today. East and North facing slopes stayed cold, we experienced very light downslope winds below ridgeline, we observed little no windslab formation. Dug on a north aspect about 150' below the ridgeline. HS 150cm, ECTX, structure looked better than I thought it would, basal depth hoar was 1F-, but we got PST 65/145 and PST 40/145 to end up 20cm from the ground.

Thanks!
