

Snow Pit near Mt. Blackmore

Date

Sun, 02/09/2025 - 12:05

Activity

Skiing

Dig on the way up to Mt. Blackmore on a W aspect at 8000'. Snow was pretty shallow (130cm) for the area. Noticed the dust layer underneath the most recent snow. Had unremarkable pit results. ECTN11 on the dust layer being the most notable. Saw a couple of small wind slabs and intentionally triggered one on a small rollover. Definitely a good bit of active transport going on out there.

Region

Northern Gallatin

Location (from list)

Mt Blackmore
