

Snow Pit Profile  
**Blackmore**  
**Northern Gallatin, MT**  
 Elevation (ft) **9500**  
 Aspect: **150**  
 Specifics: **Recent act on diff slopes. We skied slope.**

Observer: **Eric Knoff**  
**Sun Feb 06 12:35:00 MST 2011**  
 Co-ord: **45.44728 N 110.99903 W**  
 Slope: **25**  
 Wind loading: **no**

Stability on similar slopes: **Fair**  
 Air Temperature: **18 F**  
 Sky Cover: **Clear**  
 Precipitation: **Snow < 0.5 cm/hr**  
 Wind: **NW Calm**

Stability Test Notes:  
 Layer note:  
**77-84: Pro**

Notes: 2 feet of new sitting on top of a weak layer of NSF. The NSF are under a thin ice crust that formed 2-3 days ago. The columns are propagating under the crust. No cracking or collapsing, which was a surprise. Observed a nice natural off the summit, 200 ft across 1' deep.

This snowpit tells the story. 2 ft of new snow sitting on top of weak - near surface facets that formed during the first few days of February. Our columns were breaking clean on this layer. We did not get any breaks on the lower faceted layer.
